

COMP 584 Project 1 - Email Client Testing

CS Jobs Weekly email campaign

Testing goal: compare layout, responsiveness, images, button interaction, and checked-radio interactivity across email clients.

Clients tested

- Apple Mail on desktop and iPhone.
- Gmail on desktop and iPhone.
- Brevo was used to send the HTML email to the test inboxes.

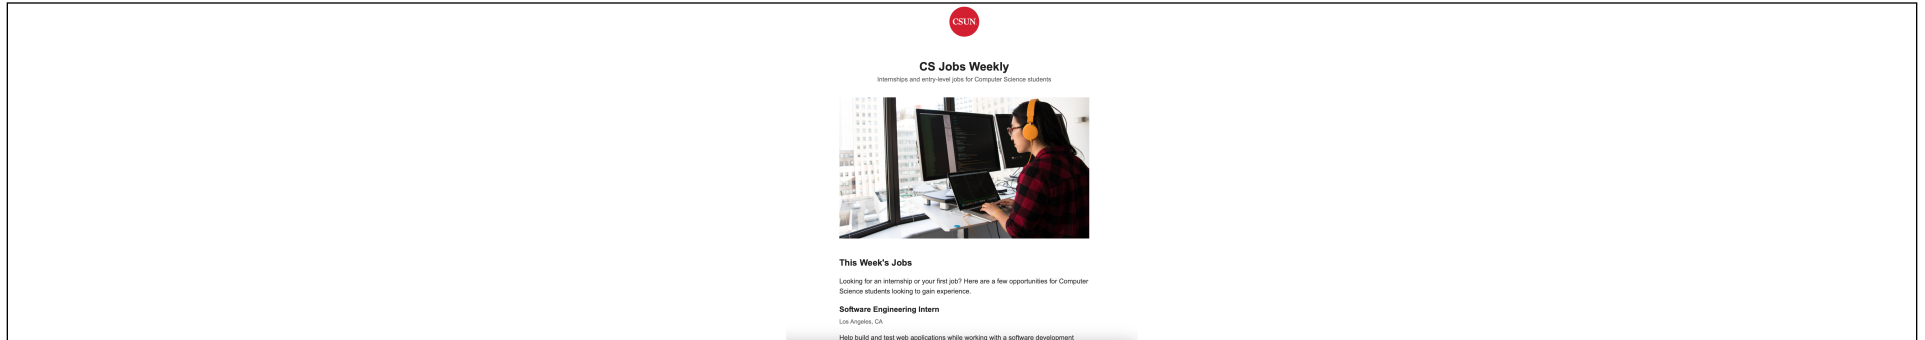

Main findings

- The core layout, hosted images, background image, and responsive stacking worked in both clients.
- Apple Mail supported the checked-radio career selector and the button animation/interactivity.
- Gmail displayed the email correctly but did not play the button animation on desktop or iPhone.
- Gmail did not support the career-path interaction the same way; the selected content was not shown.
- Gmail dark mode changed some colors, but the email remained readable.

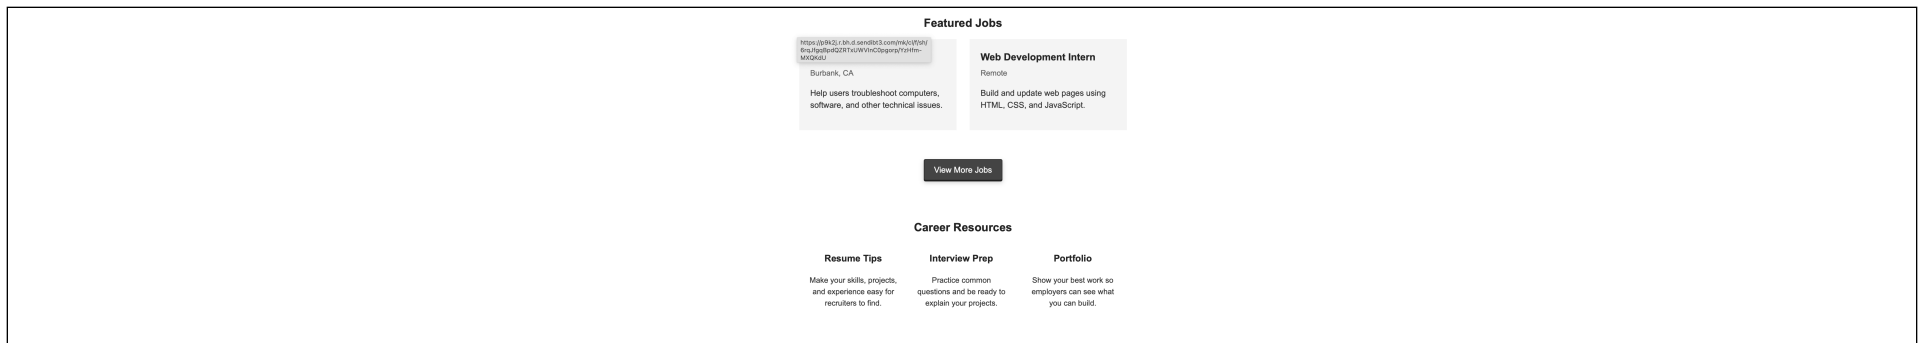

Screenshots below are from the actual test emails.

Apple Mail - Desktop

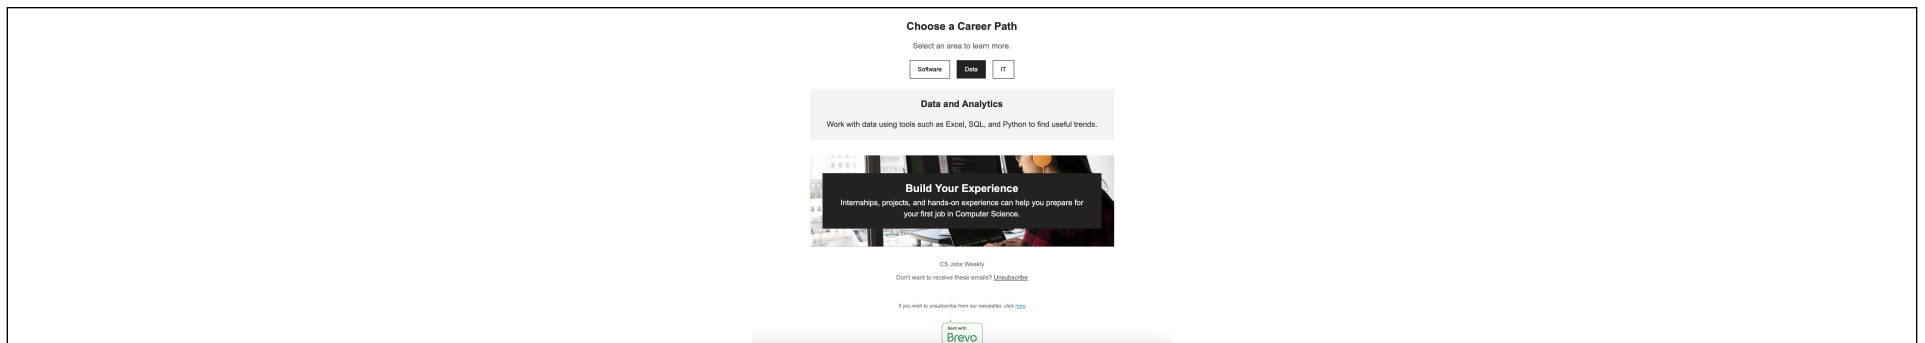

Desktop layout kept the two-column and three-column sections intact. The career selector and button interaction worked.

Header, hero image, and main content.

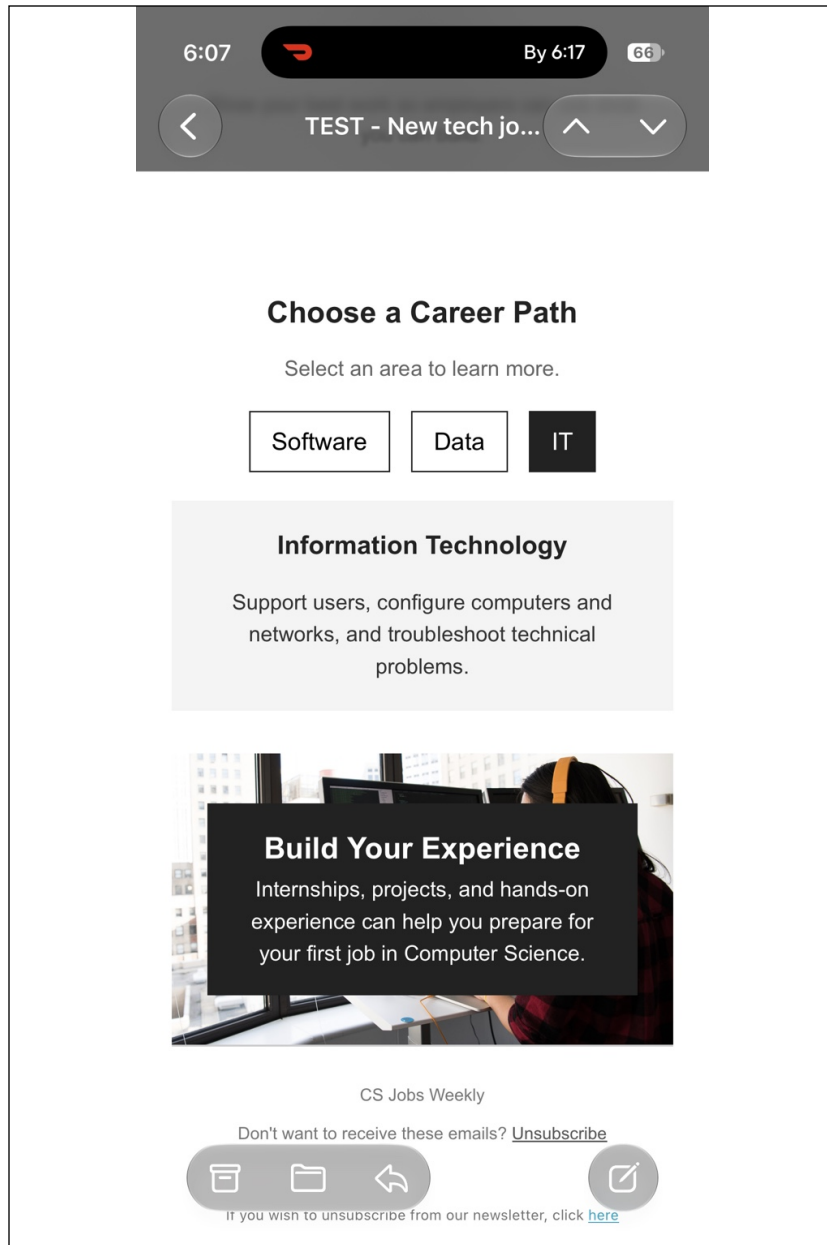

Two-column Featured Jobs, three-column Career Resources, and View More Jobs button.

Career Path interaction with Data selected and the matching content displayed.

Apple Mail - iPhone

Mobile layout remained responsive. The radio-button interaction worked and showed the selected IT content.

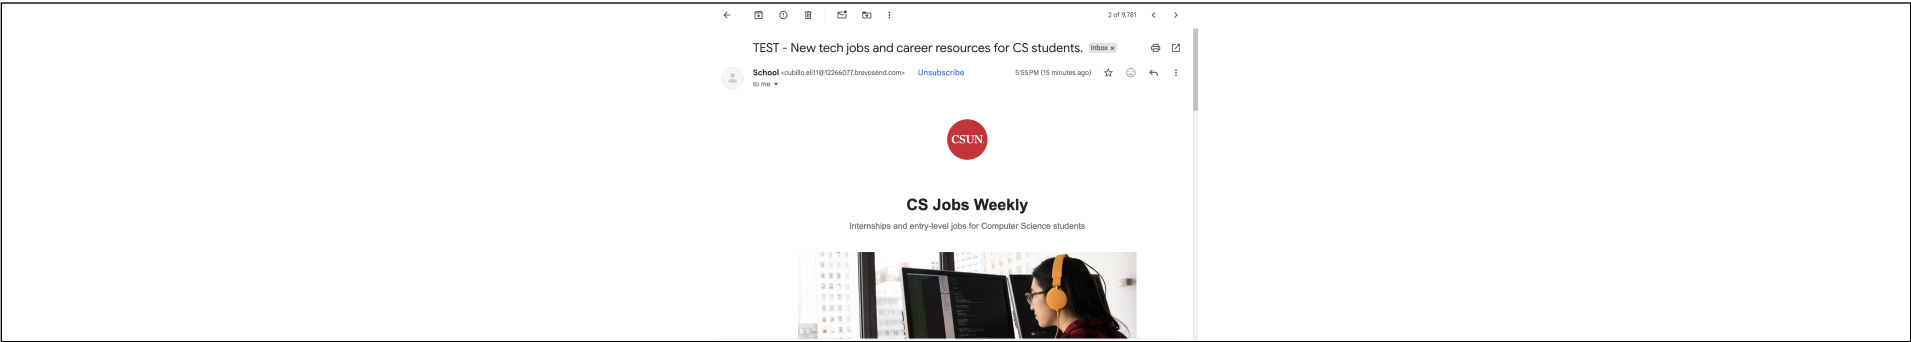

What worked

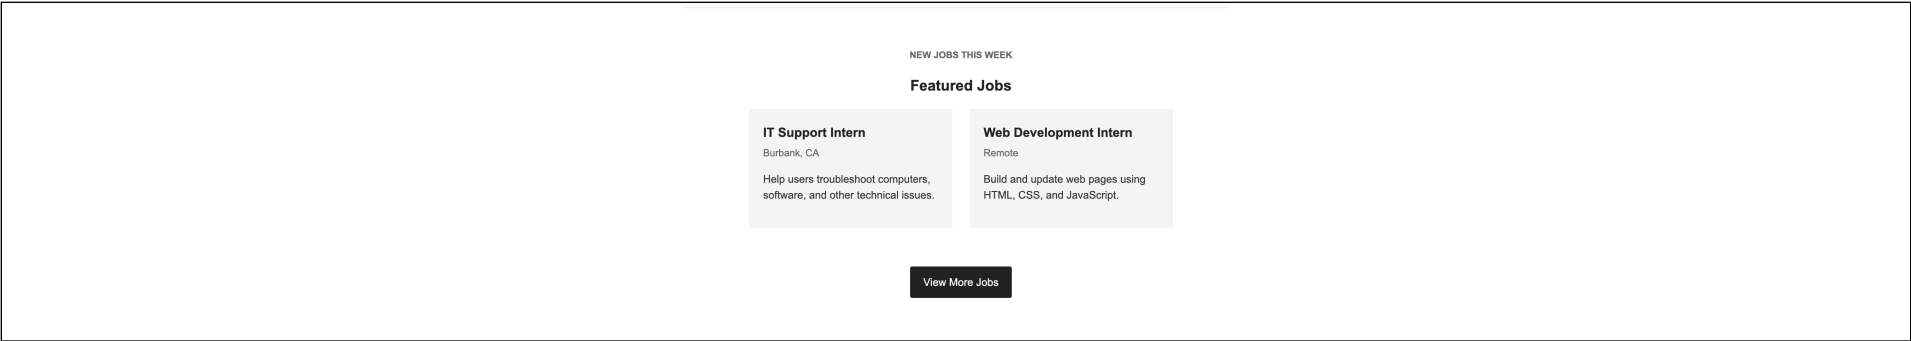

- Images loaded correctly.
- Responsive layout fit the phone screen.
- Career Path interaction worked.
- Selected IT button changed state.
- Only the Information Technology content was shown.
- Background image section stayed readable.
- Button animation/interactivity worked in Apple Mail.

Gmail - Desktop

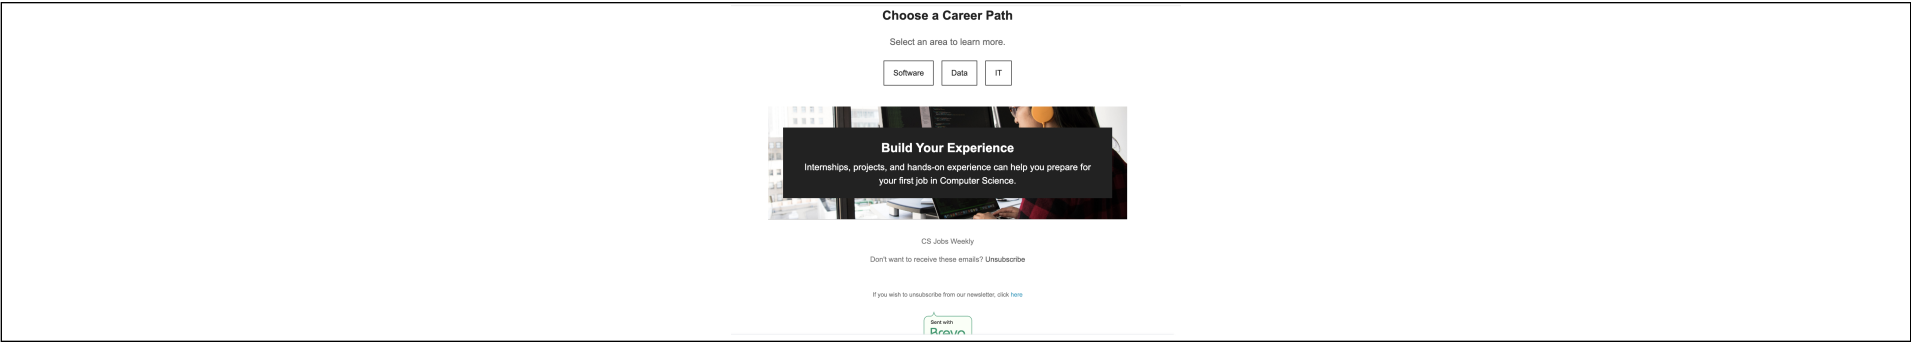

Gmail rendered the main design correctly, but some interactive CSS behaved differently from Apple Mail.

Header and hero image loaded correctly.

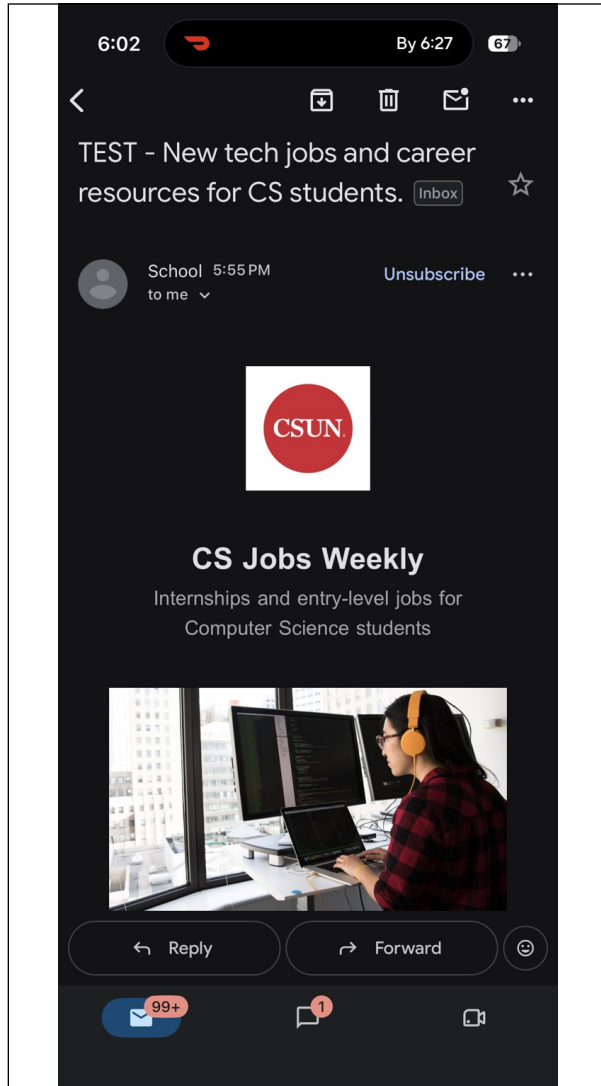

Two-column Featured Jobs and the View More Jobs button displayed correctly.

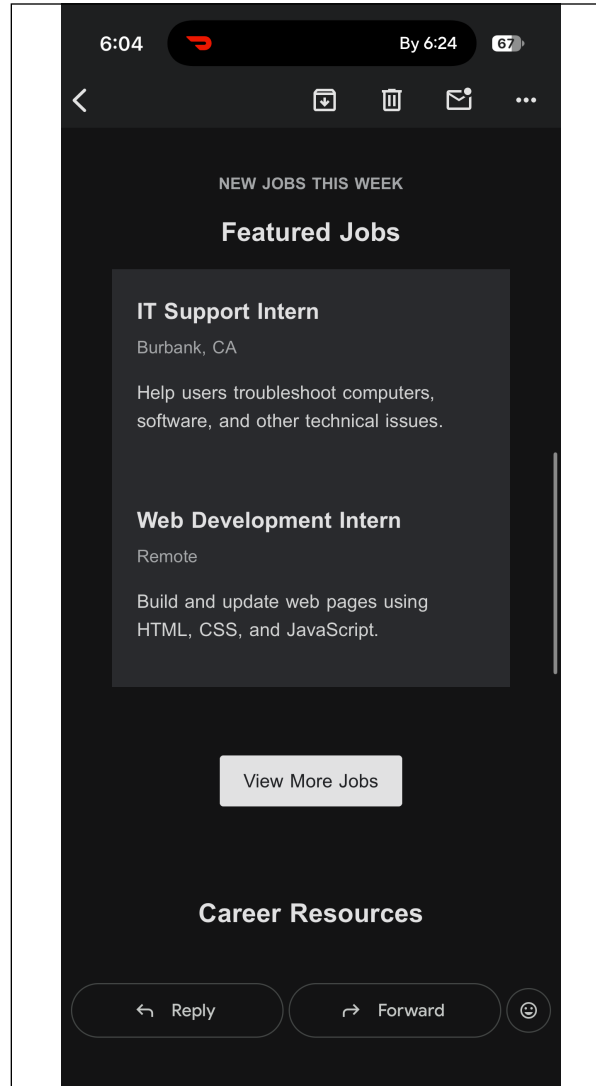

Career Path controls displayed, but the checked-radio content did not appear as expected.

Gmail - iPhone

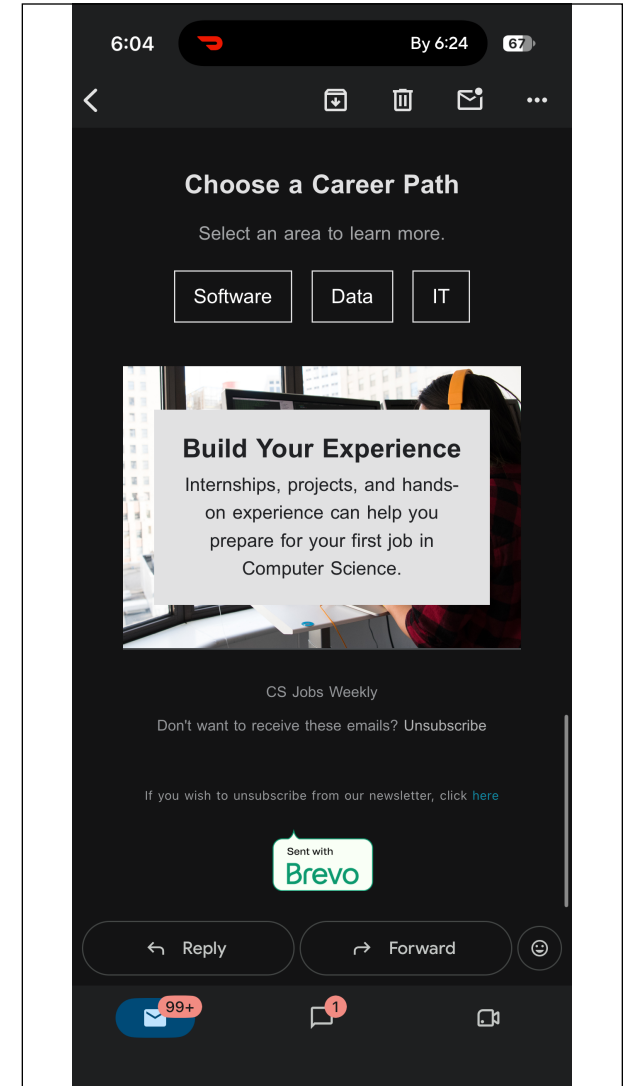

The mobile layout stacked correctly in Gmail, but the advanced interaction and animation were limited.

Header and hero image.

Featured Jobs stacked vertically; View More Jobs button displayed.

Career Path controls showed, but selected content did not display; dark mode also changed colors.

Client Comparison and Notes

Apple Mail

- Desktop and mobile layouts rendered correctly.
- Images and background image displayed.
- Responsive stacking worked on iPhone.
- Career Path radio-button interaction worked.
- Button animation/interactivity worked.

Gmail

- Desktop and mobile layouts rendered correctly.
- Images and background image displayed.
- Responsive stacking worked on iPhone.
- View More Jobs button displayed and was usable, but the animation did not play.
- Career Path checked-radio interaction did not work the same way as Apple Mail.
- Dark mode changed some colors on iPhone.

Conclusion

The campaign's core table layout and responsive design were reliable in both Apple Mail and Gmail. The biggest difference was support for advanced CSS interaction. Apple Mail handled the radio-button career selector and button animation, while Gmail showed the email content but did not support those effects the same way. This test showed why email campaigns need fallbacks for clients with limited CSS support.

Files / submission

- This PDF should be saved in the project's assets folder.
- The GitHub README should link to the Project 1 GitHub Pages site.
- Submit the new Project 1 GitHub repository link in Canvas.
